AMENDMENTS TO THE SPECIFICATION

Please replace the paragraph beginning at page 2, line 27 with the following rewritten paragraph.

Mobile systems also may have rigorous security requirements in order to protect the identity ~~identify~~ and location of mobile subscribers, as well as to insure that the mobile equipment, including software, is not involuntarily altered or corrupted, for example, by downloading uncertified software that could replace, infect, or otherwise have an adverse impact upon the software residing in the system. Known systems that dynamically provide access to services typically download software code to the client platform and execute the code on the client platform. Not only does this introduce potentially dangerous security issues, but the downloaded code can overwhelm the mobile system's limited memory capability.
